**Applicant’s Narrative on Maintaining a Navigable Channel with Aerial Photographs**

This image shows the property owners existing dock with his boat parked in its moring position. The boat hoist will only take up an additional 2 feet more of the canal then the boat currently does today. This boat is currently parked in this position daily.

This image shows there is 42 feet between the existing docks of the neighboring houses dock. The boat hoist will require 12 of the 42 feet leaving 30 feet for vessel navigation. That is adequate space for two boats to pass.
